City Administrator Report to Mayor & City Council

2018.05.11, Edition No. 308

WEEKLY UPDATE:

- Grandview: At the last council meeting Jim was asked to provide the traffic data on Grandview and has provided the following: The traffic data data 2018.02.16 is the data collected within the last year specific to the project and the Grandview Corridor. Additionally, attached is traffic data available prior to the Bolton-Menk work done last year on Grandview.Specifically, this is the most recent DOT count from 2014 https://iowadot.gov/maps/msp/traffic/2014/cities/muscatine.pdf. There is also the attached information from the Comp Plan, which shows the 2010 DOT traffic count, and how much that traffic changed since the 1998 DOT traffic count.
- Dock: The dock formerly operated by the Meeker's and the associated fixtures have been transferred back to the City.
- Fire: Effective June 1, 2018 Captain Gary Ronzheimer will be promoted to Battalion Chief. Please help me in congratulating Gary on his promotion. Gary will assume Training and Operations as BC.
- In-Depth: If there is a particular topic or interest that you would like City staff to work into the in-depth meeting rotation, please send your ideas!
- Whicher Street and Street Matrix: Please see the attached copies of DPW Director Stineman's presentations from last night. Per Brian…The attached Whicher presentation has the detour routes that were requested. I don't have the alley matrix completely done yet and still need to have internal staff review it. I will have it to you by the end of next week.
- Refuse and recycling: Feel free to share Kevin's post about refuse and recycling pickup as there is no refuse collection on Memorial Day (May 28th), otherwise please see below.
  - Refuse, recycling collection schedule for Memorial Day Holiday is announced
  - MUSCATINE, Iowa – There will not be refuse or recycling collection on Memorial Day, Monday, May 28, according to Kristi Korpi, Solid Waste Manager for the City of Muscatine. In one of her final acts before retiring at the end of this week, Korpi released the collection schedule for the first holiday of the summer season.
  - Refuse collection for Monday (May 28) and Tuesday (May 29) will be collected on Tuesday (May 29). The regular collection schedule will resume on Wednesday (May 30). Route B recycling collection for that week will be delayed one day (Monday's collection on Tuesday, Tuesday on Wednesday, etc.). Regular recycling collection will resume on Monday (June 4).
  - The Transfer Station and Compost Site will be closed on Monday, May 28, and will resume normal operating hours on Tuesday, May 29. Transfer Station hours are 7 a.m.-3:30 p.m. Monday through Friday and 8 a.m.-12:00 p.m. on Saturday. Compost Site hours are 12-6 p.m. Sunday through Friday and 9 a.m. to 6 p.m. on Saturday.

Appendix

I. Executive Summary

The City of Muscatine is looking to reconstruct the Grandview Avenue Corridor through the City. The corridor stretches from the US 61/Dick Drake HWY on the southwest to Hershey Avenue in northeast but the study limits are from US 61/Dick Drake HWY to Pearl St, in the northeast, approximately 2.18 miles in length. For technical reasons, the corridor will be hereafter described as north-south with US 61 as the south end, and Mill Street as the north end. Grandview Avenue is also part of Iowa 92 and BUS US 61.

The City is interested in analyzing the traffic operations and safety to determine the appropriate roadway configuration. The roadway is currently a 2-lane section from US 61 to Oregon Street, after which a second northbound lane is added. A second southbound lane is added at Bleeker Street. From Bleeker Street, the corridor is a 4-lane section until the north end. Turning lanes exist at US 61, and Oregon Street/Warren Street. The city wants to review if a combination of a 2-lane and a 3-lane roadway would be appropriate to allow a complete streets project for improved bicycle and pedestrian circulation. The following summarizes the main outcomes of this study:

A. Access Management

On the eastbound approach of the intersection of Warren St/Oregon St with Grandview Avenue, the curb on the south is mountable with an open access from the back alley to Grandview Avenue (about 140 ft). This access should be reduced to a normal in/out access a 150 ft from Grandview Avenue to avoid conflicts with the eastbound queue of vehicles.

B. Safety

From the crash analysis completed, it was determined that none of the intersections analyzed have crash rates either equal to or higher than the statewide average for the same class of intersections. There were no fatal crashes but one major injury one-vehicle only crash occurred at the intersection of Warren St / Oregon St, involving an ill 64-year old driver stopped at a traffic signal. At both the intersections of US 61 / Dick Drake HWY and Warren St / Oregon St, the minor crashes account for 33% and 25% of the total intersection crashes, respectively. However, as crash frequencies are low and crash rates are almost half of the statewide average, at both locations, these two numbers become less significant. Rear end crash pattern and left turn crash patterns were identified at US 61 / Dick Drake HWY intersection. The rear end pattern is mostly caused by inadequate clearance and green times, inadequate stopping sight distance, or lack of stop warning signs. The left turn pattern is mostly caused by including inadequate clearance time, stopping sight distance, vertical alignment, and sight triangle. Both situations can be corrected during the design phase.

C. Operations

The existing traffic analysis shows that currently intersection delay is acceptable with LOS equal to or better than B and no limiting movement near capacity for all of the intersections analyzed.

The forecasted 2020 (construction year) traffic analysis shows that service levels provided by both the two-lane and three lane sections (Build scenario) along Grandview Avenue are equal to or better than B for all the intersections and are comparable with the ones provided under existing geometry and control (No Build scenario). The forecasted 2020 traffic analysis also shows that the service levels for the limiting movements are equal to or better than C, that the limiting movement delay and delays are acceptable for all the intersections and are comparable with the ones provided by the No Build scenario.

The forecasted 2040 (future year) traffic analysis shows that service levels provided by both the two-lane and three lane sections (Build scenario) along Grandview Avenue are equal to or better than C and comparable with the ones provided under existing geometry and control (No Build scenario).

The forecasted 2040 (future year) traffic analysis also shows, however, that the service level for the limiting movement (eastbound left movement) at Franklin St intersection is equal to E and that the limiting movement is near capacity with undesirable delay in the PM peak hour. However, this movement has only one vehicle in the PM peak hour and therefore, the result is overall insignificant. Additionally, drivers have historically adjusted to traffic conditions by taking alternate paths or changing their time schedules. At the remaining intersections, the service levels for the limiting movements are equal to or better than D, the limiting movement delay and delays are acceptable are comparable with the ones provided by the No Build scenario.

The travel times for all scenarios vary from 30 mph to 35 mph, on both directions, for current conditions and future scenarios, both Build and No Build. The average travel time in all scenarios is 3.9 ± 0.3 minutes, where the variation is insignificant.

The warrant analysis completed shows that currently signal warrants are met at the intersection of US 61 / Dick Drake HWY (2018), and Oregon (2040), which are already signalized. At the intersection of S Houser St / Sampson St, which is currently signalized, no warrants are met. However, this intersections is proposed to be reconstructed with a signal, mostly because Oregon St is the main access to the grain processing center, whose peak hour may not match the corridor peak hour and also because the random number of trucks, which may be high at times. All-way stop control warrants are met only at US 61 / Dick Drake HWY and Warren St / Oregon St intersections.

The conversion of Grandview Avenue from the current configuration to 2-lane section from the south end to S Houser St / Sampson St , and 3-lane section from S Houser St / Sampson St to the north end will not cause any negative impact on the traffic operations and safety of the corridor, with advantage of providing a complete streets project for improved bicycle and pedestrian circulation.

Operations analyses have shown the need to add left turn lanes at both north and southbound approaches at Musser St, Warren St/Oregon St, Bond St, and Franklin St, due to the 4-lane to 3-lane conversion. Southbound and northbound through lanes were eliminated at these same intersections but the shared thru/right lane was maintained. At Warren St intersection eastbound approach, the existing dedicated right turn lane was removed.

II. Introduction

The City of Muscatine is looking to reconstruct the Grandview Avenue Corridor through the City. The corridor stretches from the US 61/Dick Drake HWY on the southwest to Hershey Avenue in northeast but the study limits are from US 61/Dick Drake HWY to the transition of Green Street with Grandview Avenue (Mill Street), in the northeast, approximately 2.18 miles in length. For technical reasons, the corridor will be hereafter described as north-south with US 61 as the south end, and Mill Street as the north end. Grandview Avenue is also part of Iowa 92 and BUS US 61. See **Appendix A** for an overview of the Project Extents.

The following intersections along the University Avenue Corridor are included in the scope of the study:

- US 61 / Dick Drake HWY
- S Houser St / Sampson St
- Musser St
- Warren St / Oregon St
- Bond St
- Franklin St

The City is interested in analyzing the traffic operations and safety to determine the appropriate roadway configuration. The roadway is currently a 2-lane section from US 61 to White Street, after which a second northbound and southbound lanes are added to make the corridor a 4-lane section

until the north end. Turning lanes exist at US 61, and Oregon Street/Warren Street. The city wants to review if a combination of a 2-lane and a 3-lane roadway would be appropriate to allow a complete streets project for improved bicycle and pedestrian circulation. An overview of the 2-lane and the 3-lane section plus typical section can be found in **Appendix B**.

The intersections of Grandview Avenue at US 61, Sampson Street/S Houser Street, and Oregon Street/Warren Street are signalized. The remaining intersections are side-street stop-controlled. The inclusion of these streets in the study area will allow the study to determine the effect on the delay and queueing of potential 2-lane or 3-lane section (from 4-lane), and future growth on the system. The crash history will be analyzed to identify any issues and potential trends, if any.

The purpose of this traffic study is to identify potential transportation issues created as a result of changes to the roadway system and surrounding area and recommend solutions to mitigate the potential issues to provide a safer and efficient transportation facility for vehicular, pedestrian and bicycle traffic.

III. Data Collection

Thirteen-hour Turning Movement Counts for the intersections of Grandview Avenue at HWY 61/Dick Drake Hwy, Grandview Avenue at S Houser St/Sampson St, and Grandview Avenue at Musser Street were performed on November 28, 2017, while Thirteen-hour Turning Movement Counts for intersections of Grandview Avenue at Warren Street/Oregon Street, Grandview Avenue at Bond Street, and Grandview Avenue at Franklin Street were performed on November 30, 2017. AM Peak Hour and PM Peak Hour were determined to be 7:15-8:15 am and 3:30-4:30 pm respectively. The turning movement counts were not balanced as there are crossing streets and driveways between the locations where turning movement counts occurred. See **Appendix C** for Peak hour count information.

According to the Iowa DOT, the 2014 AADT is 3,950 vpd between US 61 and Houser Street intersections, and the 2013 AADT is 4,740 vpd form Houser Street to the north end of the corridor.

IV. Safety Review

A crash review was completed for each intersection in this study. The crash analysis was completed using the crash data available through the Iowa DOT Crash Mapping Analysis Tool for 2012 to 2016.

Summaries of crashes according to frequency and rate, severity, and type, for each intersection included in the study, are depicted in **Table 1** though **Table 3**. Intersection crash diagrams were created for each studied intersection and can be found in **Appendix D**.

Table 1: Crash Frequency and Rate

Intersection	Crash Frequency and Rate			
	Entering Volume	Number of Crashes	Crash Rate	Statewide Crash Rate*
US 61 / Dick Drake HWY	12,450	16	0.71	1.0
S Houser / Sampson St	6,465	1	0.09	0.7
Musser St	5,300	2	0.21	0.7
Warren St / Oregon St	10,350	6	0.32	0.8
Bond St	9,250	2	0.12	0.8
Franklin St	9,400	1	0.06	0.8
* Per Million Entering Vehicles				

None of the intersections have a crash rate either equal to or higher than the statewide average for its corresponding category. Therefore, no concerns were found regarding either crash rates or frequency.

Table 2: Crash Severity

Intersection	Crash Severity					
	Fatal	Major Injury	Minor Injury	Possible Injury	PDO	Total
US 61 / Dick Drake HWY	0	0	4	2	10	16
S Houser / Sampson St	0	0	0	0	1	1
Musser St	0	0	0	1	1	2
Warren St / Oregon St	0	1	1	1	3	6
Bond St	0	0	0	0	2	2
Franklin St	0	0	0	0	1	1

At the intersection of US 61 / Dick Drake HWY, the number of minor injuries is 25% of the total, which could be a concern. However, as the crash rate is less than half of the statewide average (1.0), that injury crash frequency is within the normal range. These minor crashes were 2 left turn, rear end, and right angle.

At the intersection of Warren St / Oregon St, the number of major and minor injury crashes is 33% of the total, which could be a concern. However, as the crash rate is less than half of the statewide average (0.8), that injury crash frequency is probably within the normal range. The major injury crash involved only an ill 64-year old driver stopped at a traffic signal heading west. No details were disclosed in the Crash Detail Report. The minor injury involved a driver going south and turning left, who ran the traffic signal and hit a driver going north.

The crash severity summary does not show any concerns at the remaining intersections.

Table 3: Crash Type

Intersection	Crash Type								
	Rear End	Right Angle	Sideswipe	Left Turn	Head On	Run Off Road	Collision with Animal	Other	Total
US 61 / Dick Drake HWY	5	3	3	4	0	1	0	0	16
S Houser / Sampson St	0	0	0	0	0	1	0	1	1
Musser St	1	0	0	0	0	1	0	0	2
Warren St / Oregon St	0	1	0	4	0	1	0	0	6
Bond St	0	1	1	0	0	0	0	0	2
Franklin St	0	1	0	0	0	0	0	0	1

The only concerns in terms of crash patterns is rear end at US 61 / Dick Drake HWY and left turns at US 61 / Dick Drake HWY and at Warren St / Oregon St.

Four out of the five rear end crashes at US 61 / Dick Drake HWY occurred on the southbound approach. This pattern is mostly caused by inadequate clearance and green times, inadequate stopping sight distance, or lack of advanced warning signs, which can be corrected during the design phase.

All four left turn crashes at US 61 / Dick Drake HWY occurred on the northbound approach, turning left to US 61. This pattern is mostly caused by including inadequate clearance time, stopping sight distance, vertical alignment, and sight triangle, which can be corrected during the design phase.

At Warren St / Oregon St, there were four left turn crashes but they do not represent a pattern as two of them involved vehicles turning southbound to east, one was turning westbound to south, and one was turning northbound to west.

No concerns were identified at the other intersections.

While the crash rates are below the statewide averages for the type of intersections, the number of crashes can be reduced with mitigation. The conversion of a 4 lane roadway to a 3-lane roadway has shown a potential 18% reduction in crashes, according to the available literature. The conversion of a signalized intersection into a roundabout has shown a potential 56% reduction in crash frequency, according to available literature. Additionally, route signage near the intersection could decrease the amount of crashes by reducing driver route hesitation. Crash mitigation countermeasures, as suggested in the previous paragraphs, can be implemented during the design phase.

V. Existing Conditions Review

The proposed study area is the Grandview Avenue Corridor in Muscatine, Iowa, extending from the US 61 on the south to Pearl Street on the north end. Grandview Avenue is also part of Iowa 92 and BUS US 61.

Grandview Avenue in the City of Muscatine is a 4-lane divided roadway with 2-lanes in each direction from the south city, limits where it is also HWY 61, to 700 ft north of the intersection with HWY 61/Dick Drake Hwy. At that point, it reduces width to a 2-lane roadway, with one lane in each direction to 350 ft south of the intersection at Warren St/Oregon St where it expands to a 4-lane undivided section, with two lanes in each direction. The roadway widths vary from 24 ft up to 68 ft. Some road sections have parking along one or both sides of the street, while other sections have no parking. The following provides the roadway information for each intersection.

1. Grandview Avenue at HWY 61/Dick Drake Hwy – this intersection is a 4-legged intersection with Grandview Ave extending north, Dick Drake Hwy extending east, Grandview Avenue/HWY 61 extending south, and HWY 61 extending west. HWY 61 west of the intersection is a 4-lane divided roadway with 2 lanes in each direction and a left turn lane approaching the intersection. It has a rural section that is 88-ft wide including 10-ft paved shoulders. Grandview Avenue is a 4-lane road with left turn lanes from each approach. It is a rural section that has a pavement width of 68-ft including 2-ft wide paved shoulders. There are also 8-ft wide granular shoulders. There is a painted median dividing the turn lane and the opposing through lane. Dick Drake Hwy is a 2-lane roadway with one lane in each direction and a left turn lane approaching the intersection. It is 42-ft wide edge of pavement to edge of pavement. The intersection is signalized. Speed limits are 45 mph north, south and west of the intersection, and 40 mph east of the intersection. Parking is not allowed on any of the roads connecting to this intersection.

2. Grandview Avenue at S Houser St/Sampson St – this intersection is a 4-legged intersection with Grandview Ave extending north/south, S Houser St extending west, and Sampson St extending east. Grandview Avenue is a 2-lane roadway. It has a rural section that is 32-ft wide including 4-ft wide paved shoulders. There are also 4-ft wide granular shoulders. S Houser St has an urban section measuring 32 ft back-of-curb to back-of-curb with one lane in each direction. Sampson St has an urban roadway section measuring 38 ft back-of-curb to back-of-curb with one lane in each direction, but narrows to 32 ft back-of-curb to back-of-curb 300 ft east of the intersection. There are "No Parking" signs posted along Grandview Avenue, but not along S Houser St or Sampson St. The intersection is signalized. Grandview Avenue has a posted speed limit of 35 MPH through the intersection, where it changes to 45 mph southwest of the intersection. S Houser St has a posted speed limit of 40 mph and Sampson St has a posted speed limit of 25 mph.

3. Grandview Avenue at Musser Street – this intersection is a 4-legged intersection with Grandview Ave extending north/south and Musser St extending east/west. Both roadways are 2-lane rural roadway section with one lane in each direction. Grandview Ave is 24-ft edge of pavement to edge of pavement with 6-ft wide granular shoulders. Musser St is 24-ft edge of pavement to edge of pavement with grass shoulders. There are "No Parking" signs posted along Grandview Avenue, but parking in permitted along Musser St. Grandview Avenue has a posted speed limit of 35 MPH through the intersection and Musser St has a posted speed limit of 25 mph. The intersection is side street stop controlled.

4. Grandview Avenue at Warren Street/Oregon Street – this intersection is a 4-legged intersection with Grandview Ave extending north/south, Warren St extending west and Oregon St extending east. Grandview Ave expands to a 4-lane undivided roadway approximately 350 ft south of the intersection with two lanes in each direction. It has an urban roadway section measuring 44 ft back-of-curb to back-of-curb. The southbound left lane is marked as a dedicated left turn lane. Warren St has an urban roadway section measuring 40 ft back-of-curb to back-of-curb. It is marked as 3 lanes with one lane heading west and two heading east. The two lanes heading east are a shared thru/left turn lane and a right turn lane. Oregon St has an urban roadway section measuring 48 ft back-of-curb to back-of-curb. It is a 4-lane undivided road with 2 lanes in each direction. The two lanes heading west are a shared thru/left turn lane and a right turn lane. The intersection is signalized. Parking is not allowed on the streets at this intersection. Grandview Avenue and Oregon St have posted speed limits of 35 mph and Warren St has a posted speed limit of 25 mph.

5. Grandview Avenue at Bond Street – this intersection is a 4-legged intersection with Grandview Ave extending north/south and Bond St extending west. There is a two-way driveway into a parking lot extending east from the intersection that is offset from Bond St 40 ft to the north. Grandview Ave is a 4-lane undivided roadway with two lanes in each direction. It has an urban roadway section measuring 44 ft back-of-curb to back-of-curb. Bond St has an urban roadway section measuring 26 ft back-of-curb to back-of-curb. It has 2 lanes with one lane in each direction. The intersection is side street stop controlled with Bond St stopping. No parking is allowed on Grandview Avenue. Bond St has parking allowed on both sides. Grandview Avenue has a posted speed limit of 35 mph and Bond St has a posted speed limit of 25 mph.

6. Grandview Avenue at Franklin Street – this intersection is a 4-legged intersection with Grandview Ave extending north/south and Franklin St extending east/west. Grandview Ave is a 4-lane undivided roadway with two lanes in each direction. It has an urban roadway section measuring 44 ft back-of-curb to back-of-curb. Franklin St has an urban roadway section measuring 36 ft back-of-curb to back-of-curb west of the intersection. Franklin Street is in disrepair to the east of the intersection. It has 2 lanes with one lane in each direction. The intersection is side street stop controlled with Franklin St stopping. No parking is allowed on

Grandview Avenue. Franklin St has parking allowed on both sides. Grandview Avenue has a posted speed limit of 35 MPH and Franklin St has a posted speed limit of 25 mph.

According to the Urban Area Federal Functional Classification map, provided by the Iowa DOT, Grandview Avenue, Dick Drake HWY and Oregon St are Minor Arterials, US 61 is Other Principal Arterial, and all the other streets are local roads. However, according to the City of Muscatine's Comprehensive Plan, Grandview Avenue and US 61 are Principal Arterials, Oregon St and Dick Drake HWY are Minor Arterials, S Houser St is a Collector, and all the other streets are Local Streets.

Grandview Avenue corridor is parallel to the Canadian Pacific Railroad tracks and the northern section of the road (north of Bond St) is also parallel to the Mississippi River shoreline. The railroad also crosses Grandview Avenue slightly north of the Day St intersection. On the north end of the corridor, Grandview Avenue turns into Green Street and connects with Hershey Avenue, which is an extension of the Mississippi Drive, currently under reconstruction.

See **Appendix A** for aerial of the project extents.

VI. Project Scenario Review

The project scenarios for this analysis include additions of some potential developments and redevelopments, lane reconfiguration and intersection control changes, and future growth.

A. POTENTIAL DEVELOPMENTS AND REDEVELOPMENTS

Some development and redevelopment between the existing conditions and the design year are expected to occur along the corridor within the project limits. One redevelopment is already expected to happen before the construction year. Other developments are expected to happen between the construction year and the design year. Some assumptions were made of areas that would be developed or redeveloped. A map with the locations of each potential development/redevelopment can be found in **Appendix E.**

There is one site considered for redevelopment before the construction year. The old Wholesale Food Outlet at the corner of Grandview Avenue and Warren Street/Oregon Street is being reopened

as a Dollar General. The building and the site will be reused with minimal changes. This is location A noted in **Appendix E**.

There are three potential development or redevelopment groupings for the design year, as follows:

1. The city owns approximately 10 acres of land southeast of the intersection of Hershey Avenue and Green Street. The site is currently vacant lots. While outside of the corridor study area, the traffic generated will impact the roadway and intersections in the corridor study area. The land is proposed as mixed use development with the intent being multi-story building having commercial on the main floor and apartment space above. A 3-story building with 2 stories of apartments was assumed. Historical data used to determine the footprint(s) of buildings on a site this size indicated 0.20 sf per sf of lot space. This gives approximately 87,000 sf of building footprint. While apartment sizes vary from location to location, a historical average of about 1150 sf per apartment was used to determine the number of apartments, which was found as being approximately 150 units. This is location B noted in **Appendix E**.

2. The currently developed commercial area on the north end of the project has potential for some redevelopment. By reconstructing the road and adding amenities to the area, there is potential to bring new investment to the area. Four properties currently unused or appearing vacant which could be redeveloped were identified. It was assumed half, or two, of these properties might be redeveloped within the 20 years from construction to the design year. The assumptions are one of the properties could be a general commercial and the other could be a high turnover sit down restaurant. The lots are all of similar size, so the general commercial was assumed at the corner of Grandview Avenue and Warren Street/Oregon Street. The restaurant was assumed on another lot to the north. This is location C noted in **Appendix E**.

3. The third potential area to experience development or redevelopment is the south end of the project where there are vacant lots that could be potentially developed. There are eight vacant lots directly adjacent to Grandview Avenue between HWY 61 and S Houser Street/Sampson Street. Since the location is farther from the city center, it was assumed two of the eight lots might be developed. The lot areas were reviewed and an approximate average size of 1.8 acres per lot was found. It was assumed the lots would be light industrial related to construction companies or small manufacturing companies. This is location D noted in **Appendix E**.

Trip generation was completed using the Trip Generation Manual, 8th Edition, Institute of Transportation Engineers, 2008. Trip generation rates were evaluated using data for Shopping Center (ITE 820), Mid-Rise Apartments (ITE 223), High-Turnover (Sit-Down) Restaurant (ITE 532), and General Light Industrial (ITE 110). The trip generation results are contained in **Appendix F**, and is also summarized in **Table 1** and **Table 2.**

Table 1: Trip Generation Summary Construction Year

Land Use	ITE Code	Proposed Size	AM Peak Hour		PM Peak Hour		Weekday	
			Entering	Exiting	Entering	Exiting	Entering	Exiting
Construction Year Redevelopment								
Shopping Center	820	19,800 SF	37	24	106	110	1186	1186
			AM Peak Hour total	61	PM Peak Hour total	216	Weekday total	2372

Table 2: Trip Generation Summary Design Year

Land Use	ITE Code	Proposed Size	AM Peak Hour		PM Peak Hour		Weekday	
			Entering	Exiting	Entering	Exiting	Entering	Exiting
Design Year Redevelopment - City Property								
Mid-Rise Apartment	223	150 Dwelling Units	16	34	36	26	517	517
Shopping Center	820	74,000 SF	79	50	259	264	2823	2761
Design Year Redevelopment - North Commercial Area								
High-Turnover (Sit-Down) Restaurant	532	5,500 SF	34	31	36	27	350	350
Shopping Center	820	6,000 SF	17	11	44	45	497	486
Design Year Redevelopment - South Industrial Area								
General Light Industrial	110	3.6 Acres	104	15	13	94	132	132
			AM Peak Hour total	391	PM Peak Hour total	844	Weekday total	8565

B. LANE CONFIGURATION

The City requested a review of the lane configuration in coordination and the incorporation of Complete Streets objectives, where applicable, in accordance with the City of Muscatine's Complete Street Policy. The proposed configuration must improve traffic flow and safety, and bicycle and pedestrian facilities along the corridor.

A concept created by Greening America's Communities with center turn lane, bike lanes and intersection revisions was utilized. The concept is subject to change as the development of the project progress to include input from the traffic study as well as input from a stakeholders group.

The City wants to evaluate the following lane configuration:

- Two-lane section from US 61 / Dick Drake HWY intersection to S Houser / Sampson St intersection
- Three-lane section from S Houser / Sampson St intersection to the north end (Pearl St intersection)

An overview of the 2-lane and the 3-lane section plus typical section can be found in **Appendix B**.

C. FUTURE YEAR GROWTH

The AADT Maps generated by the DOT were used to determine the potential growth on the system for the future. The growth rates were reviewed along the corridor within the study area, divided into three segments: US 61 / Dick Drake HWY through Houser St/Sampson St, Houser St / Sampson St through Bond St, and Bond St through Pearl St. As depicted in **Table 5**, in certain

periods, the annual growth rate was positive for some of the sections but the general annual growth rate from 1998 to 2014 was negative for all three segments. The traffic study prepared by Bolton & Menk for the Mississippi Drive used an annual growth rate of 1.0%. Therefore, for consistency and to be more conservative, a 1.0% annual growth rate was used in this study.

Table 5 – AADTs and Growth Rates on Grandview Avenue

		Roadway Section		
AADT Year	Annual Growth Rate	US 61 - Houser St	Houser St - Bond St	Bond St - PearlSt
1998		5500	6600	12650
	1998-2002	-0.029	-0.040	0.026

Turning Movement counts were updated for both opening and design year and can be found in **Appendix C.**

D. ALTERNATIVES ANALYZED

Two alternatives were analyzed, as follows:

I. No Build

The No Build alternative takes into consideration the traffic generated by the proposed developments and redevelopments with no roadway improvements, i.e., same lane configuration and intersection control.

II. Build

The Build Alternative takes into consideration the traffic generated by the proposed developments and redevelopments with roadway improvements, as follows:

- Reconstruction of Grandview Avenue as 2-lane section from US 61 / Dick Drake HWY intersection to S Houser / Sampson St intersection
- Reconstruction of the intersection of Grandview Avenue and S Houser / Sampson St as a 1-lane roundabout with slip lanes on both northbound east and eastbound-south directions.
- Reconstruction of Grandview Avenue as 3-lane section from S Houser / Sampson St intersection to the north end (Pearl St intersection)
- Addition of left turn lane at all intersections within the 3-lane roadway section
- Addition of turn lanes on the side street approaches if required by the traffic operation analysis to provide acceptable delays and LOS

VII. Operational Analysis

The traffic operations analysis for the intersections consider the following measures to determine the adequacy of the intersection design to meet acceptable operations: intersection delay/Level of Service (LOS) and volume-to-capacity ratios (V/C). An explanation of each of these measures is provided below:

A. LEVEL OF SERVICE AND DELAY

The operational analysis results are described as a Level of Service (LOS) ranging from A to F. These letters serve to describe a range of operating conditions for different types of facilities. Levels of Service are calculated based on the Highway Capacity Manual, 6th Edition, which defines the level of service, based on control delay. Control delay is the delay experienced by vehicles slowing down as they are approaching the intersection, the wait time at the intersection, and the time for the vehicle to speed up through the intersection and enter into the traffic stream. The average intersection control delay is a volume weighted average of delay experienced by all motorists entering the intersection on all intersection approaches. The control delay is modeled within the analysis software, Trafficware Synchro. Level of Service D is commonly taken as an acceptable design year LOS. The level of service and its associated intersection delays for signalized and unsignalized intersections, and V/C ratios are presented below. The delay threshold for unsignalized intersections is lower for each LOS compared to signalized intersections, which accounts for the fact that people expect a higher level of service when at a stop-controlled intersection.

Table 6: Level of Service Criteria

	Signalized Intersection	Unsignalized Intersection
LOS	**Control Delay per Vehicle (sec.)**	**Control Delay per Vehicle (sec.)**
A	≤ 10	≤ 10
B	>10 and ≤ 20	>10 and ≤ 15
C	>20 and ≤ 35	>15 and ≤ 25
D	>35 and ≤ 55	>25 and ≤ 35
E	>55 and ≤ 80	>35 and ≤ 50
F	>80	>50

Note: If V/C > 1.0, then LOS will be equal to F, independently of the delay.

Additional Measures of Effectiveness (MOEs) such as travel time, travel speed, queue lengths, and delay were used to evaluate either the intersections or the corridor operations.

The tabulations with all MOEs for the scenarios described can be found in **Appendix E.**

B. SCENARIOS

A total of five scenarios were prepared and evaluated, as follows:

- Existing Conditions (2018)
  Existing traffic volumes with existing lane configuration and intersection controls
- Construction Year (2020) No Build
  Existing traffic volumes plus developments with existing lane configuration and intersection controls
- Construction Year (2020) Build
  Existing traffic volumes plus developments with proposed lane configuration and intersection controls

- Future Year (2040) No Build
  Future Year traffic volumes plus developments with existing lane configuration and intersection controls
- Future Year (2040) Build
  Future Year traffic volumes plus developments with proposed lane configuration and intersection controls

A. SCENARIO 1: EXISTING CONDITIONS

A traffic operations analysis was conducted using the existing turning movement counts, existing lane configurations, and existing intersection controls, using Synchro and SimTraffic. **Table 7** includes a summary of the results of the analysis. The full table with the results of the analysis can be found in **Appendix G**.

Table 7 – Existing Conditions (2018) LOS and Queue Lengths per Intersection

Traffic Control Scenario	Peak Hour	Intersection Delay* - LOS		Maximum Delay - LOS**		Limiting Movement ***	Max Approach Queue			
							Direction		Average Queue (ft)	Max Queue (ft) ****
US 61	AM	10	B	20	C	SBL	EBT	US 61	50	125
	PM	16	B	23	C	NBL	NBL	Grandview Ave	125	250
S Houser St / Sampson St	AM	9	A	16	B	EBL	EBL/T	S Houser St	50	150
	PM	11	B	18	B	EBL	WBL/T	Sampson St	50	125
Musser St	AM	2	A	6	A	EBT	WBL/T/R	Musser St	50	75
	PM	3	A	8	A	EBT	EBL/T/R	Musser St	50	100
Warren St / Oregon St	AM	5	A	10	B	WBT	SBL	Grandview Ave	50	125
	PM	7	A	12	B	SBL	SBL	Grandview Ave	75	150
Bond St / Driveway	AM	1	A	8	A	WBL	NBL/T	Grandview Ave	25	75
	PM	1	A	3	A	EBR	EBL/T/R	Bond St	25	50
Franklin St	AM	1	A	10	B	EBT	EBL/T/R	Franklin St	25	50
	PM	1	A	14	B	EBT	SBL/T	Grandview Ave	25	50
* Delay in seconds per vehicle										
** Maximum delay and LOS on any specific approach and/or movement										
*** Limiting movement is the highest delay approach										
**** Max Queue refers to the 95th Percentile Queue (Passenger car stored length = 25 ft, Heavy vehicle stored length = 45 ft										
General Notes:										
- AM Peak Hour = 7:15 - 8:15										
- PM Peak Hour = 3:30 - 4:30										

The results show that:

- Intersection delay is acceptable at all of the intersections, which have overall LOS equal to or better than B.
- All movements at all intersections for both AM and PM peak hours have acceptable delays and LOS equal to or better than C.
- None of the limiting delays is near capacity during either the AM or the PM peak.

The travel time, delay per vehicle and average travel speeds for vehicles travelling between US 61 / Dick Drake HWY and Franklin Street were analyzed with exiting traffic volumes. **Table 8** shows the results of the analysis.

Table 8 – Existing Conditions Travel Time and Speed

Direction	Peak Hour	Travel Time (sec.)	Delay (sec./veh.)	Average Speed (mph)
Northbound	AM	238	33	33
	PM	244	38	32
Southbound	AM	215	31	35
	PM	234	45	32

Currently, the travel time along Grandview Avenue is about 3.6-4.0 minutes going either direction during both peak hours and the average speeds vary from 32 mph to 35 mph, for posted speeds of 35-45 mph. This speed accounts for delay at signals and higher speeds between the signals.

B. SCENARIO 2: CONSTRUCTION YEAR WITH EXISTING GEOMETRY

The forecasted 2020 traffic volumes were analyzed with current geometry and current intersection controls in Synchro/Simtraffic. **Table 9** depicts the results of the analysis.

Table 9: Construction Year (2020) and Existing Geometry and Controls

LOS and Queue Lengths per Intersection

Traffic Control Scenario	Peak Hour	Intersection Delay* - LOS		Maximum Delay - LOS**		Limiting Movement ***	Max Approach Queue			
							Direction		Average Queue (ft)	Max Queue (ft) ****
US 61	AM	10	B	16	B	SBT	EBT	US 61	50	125
	PM	18	B	29	C	NBL	NBL	Grandview Ave	150	350

Warren St / Oregon St	AM	6	A	10	B	WBL	SBL	Grandview Ave	50	125
	PM	7	A	13	B	SBL	SBL	Grandview Ave	75	150
Bond St / Driveway	AM	1	A	6	A	WBL	NBL/T	Grandview Ave	25	50
	PM	1	A	3	A	NBL	NBL/T	Grandview Ave	25	50
Franklin St	AM	1	A	7	A	EBT	EBL/T/R	Franklin St	25	50
	PM	1	A	10	B	WBL	SBL/T	Grandview Ave	25	75

* Delay in seconds per vehicle

** Maximum delay and LOS on any specific approach and/or movement

*** Limiting movement is the highest delay approach

**** Max Queue refers to the 95th Percentile Queue (Passenger car stored length = 25 ft, Heavy vehicle stored length = 45 ft

The results show that:

- Intersection delay is acceptable at all of the intersections, which have overall LOS equal to or better than B.
- All movements at all intersections for both AM and PM peak hours have acceptable delays and LOS equal to or better than C.
- None of the limiting delays is near capacity during either the AM or the PM peak.

The travel time, delay per vehicle and average travel speeds for vehicles travelling between US 61 / Dick Drake HWY and Franklin Street were analyzed with exiting traffic volumes. **Table 10** shows the results of the analysis.

Table 10: Construction Year (2020) and Existing Geometry and Controls

Travel Time and Speed

Direction	Peak Hour	Travel Time (sec.)	Delay (sec./veh.)	Average Speed (mph)
Northbound	AM	235	33	33
	PM	252	43	31
Southbound	AM	218	34	34
	PM	238	48	31

In the construction year, with current geometry and intersection controls, the travel time along Grandview Avenue is about 3.6-4.2 minutes going either direction during both peak hours and the average speeds vary from 31 mph to 34 mph, for posted speeds of 35-45 mph. This speed accounts for delay at signals and higher speeds between the signals.

C. SCENARIO 3: CONSTRUCTION YEAR WITH ALTERNATE GEOMETRY

The forecasted 2020 traffic volumes were analyzed with alternate geometry and intersection controls in Synchro/Simtraffic. The intersection of Houser Street was analyzed as a one-lane roundabout and the lane configuration at the intersections north of Houser reflect the proposed roadway three-lane section. **Table 11** depicts the results of the analysis.

Table 11: Construction Year (2020) and Alternate Geometry and Controls

LOS and Queue Lengths per Intersection

Traffic Control Scenario	Peak Hour	Intersection Delay* - LOS		Maximum Delay - LOS**		Limiting Movement ***	Max Approach Queue			
							Direction		Average Queue (ft)	Max Queue (ft) ****
US 61	AM	10	B	17	B	SBT	EBT	Dick Drake HWY	50	150
	PM	17	B	26	C	NBL	NBL	Grandview Ave	150	325

	PM	8	A	14	B	EBL	NBT/R	Grandview Ave	75	150
Bond St / Driveway	AM	1	A	14	B	EBL	EBL/T/R	Driveway	25	50
	PM	1	A	5	A	EBR	EBL/T/R	Driveway	25	50
Franklin St	AM	1	A	14	B	EBL	EBL/T/R	Franklin St	25	50
	PM	1	A	13	B	WBL	EBL/T/R	Franklin St	25	50

* Delay in seconds per vehicle

** Maximum delay and LOS on any specific approach and/or movement

*** Limiting movement is the highest delay approach

**** Max Queue refers to the 95th Percentile Queue (Passenger car stored length = 25 ft, Heavy vehicle stored length = 45 ft

The results show that:

- Intersection delay is acceptable at all of the intersections, which have overall LOS equal to or better than B.
- All movements at all intersections for both AM and PM peak hours have acceptable delays and LOS equal to or better than C.
- None of the limiting delays is near capacity during either the AM or the PM peak.
- The comparison with the 2018 No Build Scenario shows insignificant changes between the two.

The travel time, delay per vehicle and average travel speeds for vehicles travelling between US 61 and Franklin Street were analyzed with exiting traffic volumes. **Table 12** shows the results of the analysis.

Table 12: Construction Year (2020) and Alternate Geometry and Controls

Travel Time and Speed

Direction	Peak Hour	Travel Time (sec.)	Delay (sec./veh.)	Average Speed (mph)
Northbound	AM	239	31	33
	PM	221	32	34
Southbound	AM	252	41	31
	PM	239	44	31

In the construction year, with alternate geometry and intersection controls, the travel time along Grandview Avenue is about 3.7-4.2 minutes going either direction during both peak hours and the average speeds vary from 31 mph to 34 mph, for posted speeds of 35-45 mph. This speed accounts for delay at signals and higher speeds between the signals.

Comparing the MOEs between the 2018 No Build Scenario and 2018 Build Scenario shows insignificant changes between the two. Therefore, the proposed configuration has no adverse impact in the traffic flow along the Grandview Avenue corridor.

D. SCENARIO 4: FUTURE YEAR WITH CURRENT GEOMETRY

The forecasted 2040 traffic volumes were analyzed with current geometry and intersection controls in Synchro/Simtraffic, whose results are depicted in **Table 13**.

Table 13: Future Year (2040) and Current Geometry and Controls

LOS and Queue Lengths per Intersection

Traffic Control Scenario	Peak Hour	Intersection Delay* - LOS		Maximum Delay - LOS**		Limiting Movement ***	Max Approach Queue			
							Direction		Average Queue (ft)	Max Queue (ft) ****

* Delay in seconds per vehicle										
** Maximum delay and LOS on any specific approach and/or movement										
*** Limiting movement is the highest delay approach										
**** Max Queue refers to the 95th Percentile Queue (Passenger car stored length = 25 ft, Heavy vehicle stored length = 45 ft										

The results show that:

- Intersection delay is acceptable at all of the intersections, which have overall LOS equal to or better than C.
- All movements at all intersections for both AM and PM peak hours have acceptable delays and LOS equal to or better than D.

The travel time, delay per vehicle and average travel speeds for vehicles travelling between US 61 and Franklin Street were analyzed with exiting traffic volumes. **Table 14** shows the results of the analysis.

Table 14: Future Year (2040) and Current Geometry and Controls

Travel Time and Speed

Direction	Peak Hour	Travel Time (sec.)	Delay (sec./veh.)	Average Speed (mph)
Northbound	AM	243	39	32
	PM	253	51	31
Southbound	AM	217	33	35
	PM	245	55	30

In the future year (2040), with current geometry and intersection controls, the travel time along Grandview Avenue is about 3.6-4.2 minutes going either direction during both peak hours and the average speeds vary from 31 to 35 mph, for posted speeds of 35-45 mph. This speed accounts for delay at signals and higher speeds between the signals.

E. SCENARIO 5: FUTURE YEAR WITH ALTERNATE GEOMETRY

The forecasted 2040 traffic volumes were analyzed with alternate geometry and intersection controls in Synchro/Simtraffic, whose results are depicted in **Table 15**.

Table 15: Future Year (2040) and Alternate Geometry and Controls

LOS and Queue Lengths per Intersection

Traffic Control Scenario	Peak Hour	Intersection Delay* - LOS		Maximum Delay - LOS**		Limiting Movement ***	Max Approach Queue			
							Direction		Average Queue (ft)	Max Queue (ft) ****
US 61	AM	11	B	14	B	EBT	EBT	Dick Drake HWY	75	200
	PM	21	C	35	D	NBL	NBL	Grandview Ave	175	375
S Houser St / Sampson St	AM	6	A	9	A	NBL	NBL/T	Grandview Ave	25	100
	PM	8	A	10	B	NBT	NBL/T	Grandview Ave	50	150
Musser St	AM	3	A	9	A	WBT	WBL/T/R	Musser St	50	100
	PM	4	A	14	B	EBL	EBL/T/R	Musser St	50	100
Warren St / Oregon St	AM	8	A	15	B	SBL	SBL	Grandview Ave	75	175
	PM	12	B	21	C	EBL	WBR	Warren St	100	250
Bond St / Driveway	AM	1	A	7	A	EBL	EBL/T/R	Driveway	25	50
	PM	1	A	6	A	NBL	NBL	Grandview Ave	25	50
Franklin St	AM	1	A	13	B	WBL	WBL/T/R	Franklin St	25	75
	PM	2	A	43	E	EBL	WBL/T/R	Franklin St	25	100

* Delay in seconds per vehicle

** Maximum delay and LOS on any specific approach and/or movement

*** Limiting movement is the highest delay approach

**** Max Queue refers to the 95th Percentile Queue (Passenger car stored length = 25 ft, Heavy vehicle stored length = 45 ft

The results show that:

- Intersection delay is acceptable at all of the intersections, which have overall LOS equal to or better than C.
- Only the EBL movement at Franklin St during the PM peak hour has an unsatisfactory delay (37 sec.) and LOS (E), which may be acceptable as the overall intersection operates under a LOS equal to A during the PM peak hour. This movement has only one vehicle in the PM peak hour and therefore, the result is overall insignificant. Additionally, drivers have historically adjusted to traffic conditions by taking alternate paths or changing their time schedules. All other movements at all intersections for both AM and PM peak hours have acceptable delays and LOS equal to or better than D.
- The limiting delay is near capacity at the EBL movement of Franklin St intersection during the PM peak hour. None of the remaining limiting delays at each intersection are near capacity during either the AM or the PM peak. However, as explained in the previous paragraph, this result is overall insignificant. Additionally, the result is being caused by the additional trips generated by a potential development nearby, which there is no guarantee would happen. In the future, if the development happens, a Traffic Impact Study must be prepared which can limit either the size or the type, keeping delay and LOS at acceptable levels.

The travel time, delay per vehicle and average travel speeds for vehicles travelling between US 61 and Franklin Street were analyzed with exiting traffic volumes. **Table 16** shows the results of the analysis.

Table 16: Future Year (2040) and Alternate Geometry and Controls

Travel Time and Speed

Direction	Peak Hour	Travel Time (sec.)	Delay (sec./veh.)	Average Speed (mph)
Northbound	AM	246	38	32
	PM	255	49	31
Southbound	AM	219	29	34
	PM	246	51	30

In the future year (2040), with alternate geometry and intersection controls, the travel time along Grandview Avenue is about 3.7-4.3 minutes going either direction during both peak hours and the average speeds vary from 30 mph to 34 mph, for posted speeds of 35-45 mph. This speed accounts for delay at signals and higher speeds between the signals.

Comparing the MOEs between the 2040 No Build Scenario and 2040 Build Scenario shows insignificant changes between the two, except for the westbound left turn movement at Franklin St, with LOS equal to E and capacity near the limit. This is caused by the development being proposed on the east side of Grandview Avenue, between Bond St and Franklin St. Previous experience has demonstrated that drivers may adjust to this situation and improve operations by trying different paths or changing their work schedule.

F. INTERSECTION LANE CONFIGURATIONS

The analysis have shown the need to modify the lane configuration of some intersections to provide acceptable delays and LOS, as follows:

Table 17: Proposed Lane Configurations

Intersection	Approach			
	SB	WB	NB	EB
US 61/Dick Drake HWY	Same	Same	Same	Same
S Houser St/Sampson St	Same	Same	Same	Same
Musser St	1LT Lane Added	Same	1 LT Lane Added	Same
Warren St/Oregon St	Same	Same	1 LT and 1 Share TH/RT	1 Shared RT/TH/RT; Dedicated RT Lane Removed
Bond St	1 LT and 1 Shared Th/RT	Same	1 LT and 1 Share TH/RT	Same
Franklin St	1 LT and 1 Shared Th/RT	Same	1 LT and 1 Share TH/RT	Same

VIII. Warrant Analysis

A. Traffic Signal Warrant Analysis

The MUTCD states that the investigation of the need for a traffic control signal shall include an analysis of the applicable factors contained in the following traffic signal warrants:

- Warrant 1: Eight-Hour Vehicular Volume
- Warrant 2: Four-Hour Vehicular Volume
- Warrant 3: Peak Hour
- Warrant 4: Pedestrian Volume
- Warrant 5: School Crossing

- Warrant 6: Coordinated Signal System
- Warrant 7: Crash Experience
- Warrant 8: Roadway Network
- Warrant 9: Intersection Near a Grade Crossing

A traffic signal shall not be installed unless one or more of the warrants can be met.

Traffic signal warrant analyses were completed for some intersections along Grandview Avenue with the objective of determining whether or not the existing traffic signal is still warranted at signalized intersections and whether or not a new traffic signal is warranted at unsignalized intersections. Signal warrant analysis 1A, 1B, 2, 3, and 7 were prepared with the existing 2018 traffic volumes for the following intersections:

- US 61/Dick Drake HWY
- S Houser St/Sampson St
- Musser St
- Warren St/Oregon St
- Bond St/Driveway
- Franklin St

Signal warrant analysis 1A, 1B, 2, 3, and 7 were prepared with the forecast 2040 traffic volumes for the intersections of S Houser St/Sampson St and Warren St/Oregon St, as the warrants were not met for existing conditions at these intersections.

Table 17 shows the warrants met at each intersection with the existing 2018 and future 2040 traffic counts.

Table 17: Traffic Signal Warrant

Signal Warrant - 2018		
Intersection	Warrants Met - 2018	Warrants Met - 2040
US 61/Dick Drake HWY	1A, 2, 7	*
S Houser St/Sampson St	None	7
Musser St	None	*
Warren St/Oregon St	None	None
Bond St/Driveway	None	*
Franklin St	None	*
* Future year not analyzed		

The intersection of US 61/Dick Drake HWY, which is currently signalized, met two signal warrants for 2018. Warrants were not analyzed for 2040.

The intersection of S Houser St/Sampson St, which is currently signalized, did not meet any warrants for 2018 but met signal warrant 7 for 2040. This intersection is being proposed to be reconstructed as a roundabout.

The intersection of Warren St/Oregon St, which is currently signalized, did not meet any warrants for 2018 or 2040. This intersection is proposed to be reconstructed with a signal, mostly because Oregon St is the main access to the grain processing center, whose peak hour may not match the corridor peak hour and also because the random number of trucks, which may be high at times.

The remaining intersections, which are currently not signalized, did not meet any warrants, for 2018. Warrants were not analyzed for 2040.

The results of the traffic signal warrant analysis can be found in **Appendix H**.

B. All-Way Stop Warrant Analysis

All-Way Stop warrant analyses were completed for the same intersections where turning movements were collected. The analyses with the existing 2018 traffic volumes were prepared for the following intersections:

- US 61/Dick Drake HWY
- S Houser St/Sampson St
- Musser St
- Warren St/Oregon St
- Bond St/Driveway
- Franklin St

The analyses with the forecast 2040 traffic volumes were prepared for the intersections of S Houser St/Sampson St and Warren St/Oregon St. **Table 18** shows the warrants met at each intersection with the existing 2018 and future 2040 traffic counts.

Table 18: All-Way Stop Warrant

All Way Stop Control Warrant - 2018		
Intersection	Warrant Met - 2018	Warrant Met - 2040
US 61/Dick Drake HWY	Yes	*
S Houser St/Sampson St	No	No
Musser St	No	*
Warren St/Oregon St	Yes	Yes
Bond St/Driveway	No	*
Franklin St	No	*
* Future year not analyzed		

The intersection of US 61/Dick Drake HWY, which is currently signalized, met the warrant for 2018. Warrant was not analyzed for 2040.

The intersection of S Houser St/Sampson St, which is currently signalized, did not meet the warrant for either 2018 or 2040. This intersection is being proposed to be reconstructed as a roundabout.

The intersection of Warren St/Oregon St, which is currently signalized, met the warrant for both 2018 and 2040.

The remaining intersections, which are currently not signalized, did not meet any warrants for 2018. Warrant was not analyzed for 2040.

The results of the all-way stop warrant analysis can be found in **Appendix H.**

C. Justification

- Traffic signals are justified today at the intersections of US 61 / Dick Drake HWY and S Houser St / Sampson St
- Roundabout is deemed to be justified at the intersection of S Houser St / Sampson St, due to signal warrants and safety concerns
- A traffic signal is not justified at the intersection of Warren St / Oregon St, which is currently signalized, but an all-way stop control is justified.
- Neither traffic signals nor all-way stop control are justified at the intersections of Musser St, Bond St / Driveway, and Franklin St.

IX. Conclusions & Recommendations

The purpose of this traffic impact study is to identify potential transportation issues created as a result of changes to the roadway system and surrounding area and recommend solutions to mitigate the potential issues to provide a safer transportation facility for vehicular, pedestrian and bicycle traffic.

A. Access Management

On the eastbound approach of the intersection of Warren St/Oregon St with Grandview Avenue, the curb on the south is mountable with an open access from the back alley to Grandview Avenue (about 140 ft). This access should be reduced to a normal in/out access a 150 ft from Grandview Avenue to avoid conflicts with the eastbound queue of vehicles.

B. Safety

From the crash analysis completed, it was determined that none of the intersections analyzed have crash rates either equal to or higher than the statewide average for the same class of intersections. There were no fatal crashes but one major injury one-vehicle only crash occurred at the intersection of Warren St / Oregon St, involving an ill 64-year old driver stopped at a traffic signal. At both the intersections of US 61 / Dick Drake HWY and Warren St / Oregon St, the minor crashes account for 33% and 25% of the total intersection crashes, respectively. No immediate cause could be identified but substandard geometrics can be connected to unsafe conditions. During the design phase, geometry should be evaluated to identify if any substandard geometric exists and the corresponding countermeasures. Rear end crash pattern and left turn crash patterns were identified at US 61 / Dick Drake HWY intersection. Rear end crashes are mostly caused by inadequate clearance and green times, and inadequate stopping sight distance, while left turn crashes are mostly caused by including inadequate clearance time, stopping sight distance, vertical alignment, and sight triangle. Both patterns can be corrected during the design phase.

C. Operations

The existing traffic analysis shows that currently intersection delay is acceptable with LOS equal to or better than B and no limiting movement near capacity for all of the intersections analyzed.

The forecasted 2020 (construction year) traffic analysis shows that service levels provided by both the two-lane and three lane sections (Build scenario) along Grandview Avenue are equal to better than B for all the intersections and are comparable with the ones provided under existing geometry and control (No Build scenario). The forecasted 2020 traffic analysis also shows that the service levels for the limiting movements are equal to or better than C, that the limiting movement delay and delays are acceptable for all the intersections and are comparable with the ones provided by the No Build scenario.

The forecasted 2040 (future year) traffic analysis shows that service levels provided by both the two-lane and three lane sections (Build scenario) along Grandview Avenue are equal to or better than C and comparable with the ones provided under existing geometry and control (No Build scenario). The forecasted 2040 (future year) traffic analysis also shows, however, the EBL movement at Franklin St during the PM peak hour has an unsatisfactory delay (37 sec.) and LOS (E), which may be acceptable as the overall intersection operates under a LOS equal to A during the PM peak hour. This movement has only one vehicle in the PM peak hour and therefore, the result is overall insignificant. Additionally, drivers have historically adjusted to traffic conditions by taking alternate paths or changing their time schedules. All other movements at all intersections for both AM and PM peak hours have acceptable delays and LOS equal to or better than D.

The limiting delay is near capacity at the EBL movement of Franklin St intersection during the PM peak hour. None of the remaining limiting delays at each intersection are near capacity during either the AM or the PM peak.

The travel times for all scenarios vary from 31 mph to 35 mph, on both directions, for current conditions and future scenarios, both Build and No Build. The average travel time in all scenarios is 3.9 ± 0.3 minutes, where the variation is insignificant.

The warrant analysis completed shows that currently signal warrants are met at the intersection of US 61 / Dick Drake HWY (2018), and S Houser St/Sampson St (2040), which are already signalized. At the intersection of Warren St/Oregon St, which is currently signalized, no warrants are met. However, this intersection is proposed to be reconstructed with a signal, mostly because Oregon St is the main access to the grain processing center, whose peak hour may not match the corridor peak hour and also because the random number of trucks, which may be high at times. All-way stop control warrants are met only at US 61 / Dick Drake HWY and Warren St / Oregon St intersections.

The conversion of Grandview Avenue from the current configuration to 2-lane section from the south end to S Houser St / Sampson St , and 3-lane section from S Houser St / Sampson St to the north end will not cause any negative impact on the traffic operations and safety of the corridor, with advantage of providing a complete streets project for improved bicycle and pedestrian circulation.

Operations analyses have shown the need to add left turn lanes at both north and southbound approaches at Musser St, Warren St/Oregon St, Bond St, and Franklin St, due to the 4-lane to 3-lane conversion. Southbound and northbound through lanes were eliminated at these same intersections but the shared thru/right lane was maintained. At Warren St intersection, the existing dedicated eastbound right turn lanes was removed.

REMARKS:

Street Prioritization Matrix

Council In-depth Session

May 10, 2018

Identify Potential Projects

- Review prior fiscal years' unfunded projects
- Review latest dTIMS Pavement Evaluation Report.
- Review the Bi-State Regional Commission – Long Range Transportation Plan.
- Review staff (police, fire, streets, etc.) reported problems.
- Review Customer Service Requests.
- Review Council requests and citizen complaints.
- Consolidate lists into one list.

Confirm list of projects

- Public Works Director prepares a list of projects to be considered.
- Street division staff go out to each location and verify the onsite conditions
- Street Manager and Director verify the projects to be prioritized.
- Projects are separated into the appropriate programs.
- The programs are:
    - Street Reconstruction
    - Full Depth Patching Program
    - Street Resurfacing Program
    - Alley Reconstruction and Resurfacing Program (coming soon)
- Street Manager measures areas to be repaired for cost estimate
- A final project list is prepared.

Evaluation of Projects

- Staff evaluates projects based on the following factors:
  - Future Utility Work Planned
  - Ease of Construction
  - Traffic Counts
  - Pavement Condition
  - Staff Assessment
  - Remaining Life of Pavement
  - Cost of Construction
- The evaluations are put on a spreadsheet and tabulated
- The projects are then ranked within their grouping and a final priority list is developed.

Street Rating Factors

	Points	Definitions
Future Utility Work Planned		
Work Scheduled current year	0	This factor is used when utility work is planned on the street section. Work will wait until after the utility work has been completed.
Work Scheduled following year	2	
No Work Scheduled	10	
Ease of Construction		
Less than one week to complete	8 to 10	Ease of construction is defined as how quickly a project can be completed. The more quickly a project can be done to faster another project can be started. Therefore more points should be given to those projects that take less time.
One to two weeks to complete	5 to 7	
Two weeks to one month to complete	2 to 4	
More than one month to complete	0 to 1	
Traffic Counts		
9,000 or more vehicles per day	9 to 10	Points will be given based upon the number of vehicles per day. It is in the best interest of the community to maintain and repair streets with higher usage.
7,000 to 8,999 vehicles per day	7 to 8	
5,000 to 6,999 vehicles per day	5 to 6	
3,000 to 4,999 vehicles per day	3 to 4	
1,000 to 2,999 vehicles per day	1 to 2	
Less than 1,000 vehicles per day	0	
Pavement Condition		
PCI Index lower than 20	2 to 4	The lower the pavement condition index the worse the condition of the street. However, streets below 20 should no longer be repaired and should be moved to the reconstruction list. Streets above 60 will be put in the preventive maintenance program. Streets between 21 and 60 will be considered for repairs.
PCI Index between 21 and 40	8 to 10	
PCI Index between 41 and 60	5 to 7	
PCI Index between 61 and 80	1 to 3	
PCI Index between 81 and 100	0	
Staff Assessment		
Critical to Repair	10	Public Works Street Department Staff deal with city streets daily, their knowledge of the system is important and their input should be considered. Staff have the ability to rank street repairs based on their assessment of how urgent repairs are needed.
High need to repair	8 to 9	
Moderate need to repair	6 to 7	
Some need to repair	2 to 5	
Low need to repair	0 to 1	
Remaining Life of Pavement		
Less than 2 years	10	An estimate on the remaining life of the pavement assuming no improvements are made. The shorter the projected lifespan the higher the number of points given.
3 to 5 years	5 to 9	
6 or more years	0 to 4	
Cost of Construction		
Project costs less than $15K	9 to 10	Cost of construction is an important factor when considering the city's limited resources. A lot of small projects can be completed for every large one built. More points are to be given to the smaller projects.
Project cost between $16K to $99K	7 to 8	
Project cost between $100K to $200K	5 to 6	
Project cost between $201K to $399K	3 to 4	
Project cost more than $400K	0 to 2	

Project Fund Allocation F.Y. 2019 ≈ $1 Million

- This year planning to only repair concrete streets
- $100,000 for railroad crossing repair at Dick Drake Way
- $100,000 for alley resurfacing
- $800,000 for full depth concrete patching

Proposed FY 18-19 Full-Depth Patch Streets

Whicher Street

Council In-depth

May 10, 2018

Neighborhood Meeting Held 4/24/18

- 21 Non-city staff signed in
- 10 Whicher addresses
- 1 Valley address
- 2 Lucas addresses
- 1 8th Street address

Staff Proposal

- Stabilize the fill area
- Add compacted fill to remove the “roller coaster”
- Address stormwater runoff
- Address traffic speed with signage
- Re-pave and open roadway

Public Input

- No!
- Concerns
  - “Racetrack”
  - Safety because of past history
  - Landfill stability
  - Children play here
  - Stormwater
  - Traffic control

Staff Input

- A closed road has no value to the public
- Best option for detour during West Hill work
  - Street widths and on-street parking issues on others
- Access for public safety vehicles
- Why provide a “private park” to residents?
- We have time to evaluate this and make a sound decision, just don’t want to spend the time and money if not going to be approved.

Options

- Spend money on more evaluation, survey and draft plan
- Abandon project and leave alone
- Sell right of way behind 939 Whicher to adjacent owners
